Version 2

February 2026

One-time setup tool — maps AD department names to COL_INS_CTR domain codes

Department_to_Domain_CrosswalkV2.py

Purpose

A setup and maintenance tool. Reads unique department names from the parsed AD file and the COL_INS_CTR coded domain from the GDB, then uses fuzzy matching to suggest mappings. Output is an Excel file for manual review and verification. The verified crosswalk drives the asgn_to field population in Step 5.

When to Run

- Once during initial setup — already complete;
Department_to_Domain_CrosswalkV2.xlsx exists and is verified with 108 mappings
- When new departments appear in AD that are not in the crosswalk

Requirements

- ArcGIS Pro / arcpy (reads COL_INS_CTR domain from GDB)
- Parsed AD Excel

Outputs

Item	Value	Notes
Department_to_Domain_CrosswalkV2.xlsx	ActiveDirectoryParsing\	Three sheets: Department_Crosswalk, Domain_Codes_Reference, Instructions
Verified_Code column	In workbook	Fill in manually — this is what the pipeline reads

Matching Logic

Combines full description similarity (50% weight), word overlap Jaccard similarity (30% weight), and substring match bonus (20% weight) to produce a confidence score. Items below 60% are flagged for manual review. High confidence matches (80%+) should still be verified.
